

- We made a total expense attribute under customers which is calculated by adding the flight cost and the amount they spend at a property. This is due to the Jim Halpert case which had a total cost that included both the flight and the amount they spent on a reservation at a property.
- We made a arrival date attribute on the take off and lands at relationship since we had to keep track of the departure date.
- We are assuming that airlines can have the same name so we decided not to make the airline name a key attribute which makes it a weak entity related to the strong entity flights since every flight will have a airline but every airline may not have a flight.
- We are assuming that attractions closest to properties will be written in the description of a property. For example Michael Scott's property is a 2 minute walk from the beach which should be written in the property description. Also descriptions about the properties such as m bedroom m bathroom will be written inside the description and not under amenities.
